

Instagram Inbox Connection – Troubleshooting Guide

Use this guide when Instagram messages are not appearing in the **SRLINES Omni Inbox**. The checks below focus on client-side Instagram and Meta asset configuration.

1

Professional Account

Make sure the Instagram account is set as a **Business** or **Creator** professional account.

2

Facebook Page Connection

Confirm that the Instagram account is connected to the **correct Facebook Page**. Also verify the asset relationship inside Meta Business Settings as explained on the next page.

3

Check Account Status

Open: **Instagram** → **Settings and Activity** → **Account Status**

Make sure there are no restrictions, warnings, or disabled features.

4

Allow Message Access to Connected Tools

Open: **Instagram** → **Settings and Activity** → **Messages and Story Replies** → **Message Controls** → **Connected Tools**

Turn ON **Allow Access to Messages**.

5

Check Age & Country Restrictions

Temporarily remove any minimum-age or country-based restrictions from the Instagram account for testing.

6

Check Message Privacy Settings

Review Message Controls and temporarily allow message requests from the widest possible audience for testing.

7

Reconnect the Account

If everything above is correct but messages are still not appearing: disconnect Instagram from the Facebook Page, reconnect it with the correct Page, then reconnect/onboard the account again with **SRLINES wCRM**.

8

Test from Different Accounts

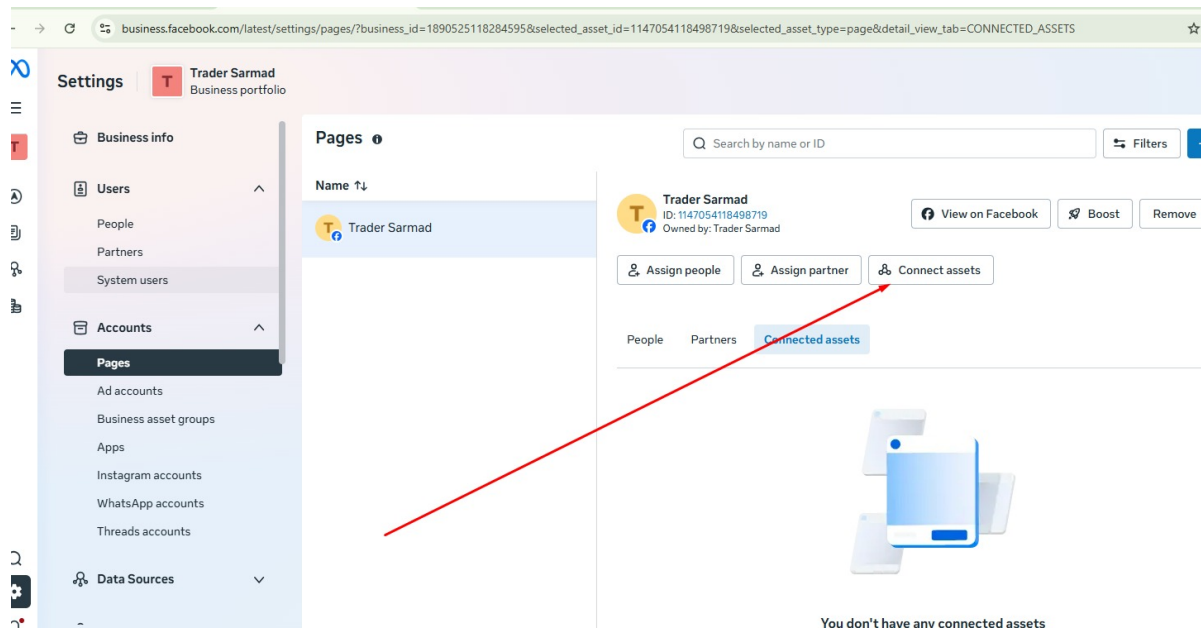

Send test DMs from **2–3 different Instagram accounts** that are not admins, developers, or testers of the connected business account.

IMPORTANT

If all checks are correct and messages still do not appear, the issue may be related to **Instagram/Meta account-level messaging provisioning or synchronization**.

Critical Check: Is Instagram Actually a Connected Asset?

An Instagram profile can look connected during normal use or onboarding, while the Facebook Page still shows **no Instagram account under Connected assets** inside Meta Business Settings. In that state, the Page and Instagram account do not have the expected asset-level relationship for the business portfolio. This can explain why one client works while another client, using the same SRLINES app and onboarding flow, does not receive Instagram message events.

Example: Missing connection. The Page's Connected assets tab is empty and shows that there are no connected assets.

How this can happen

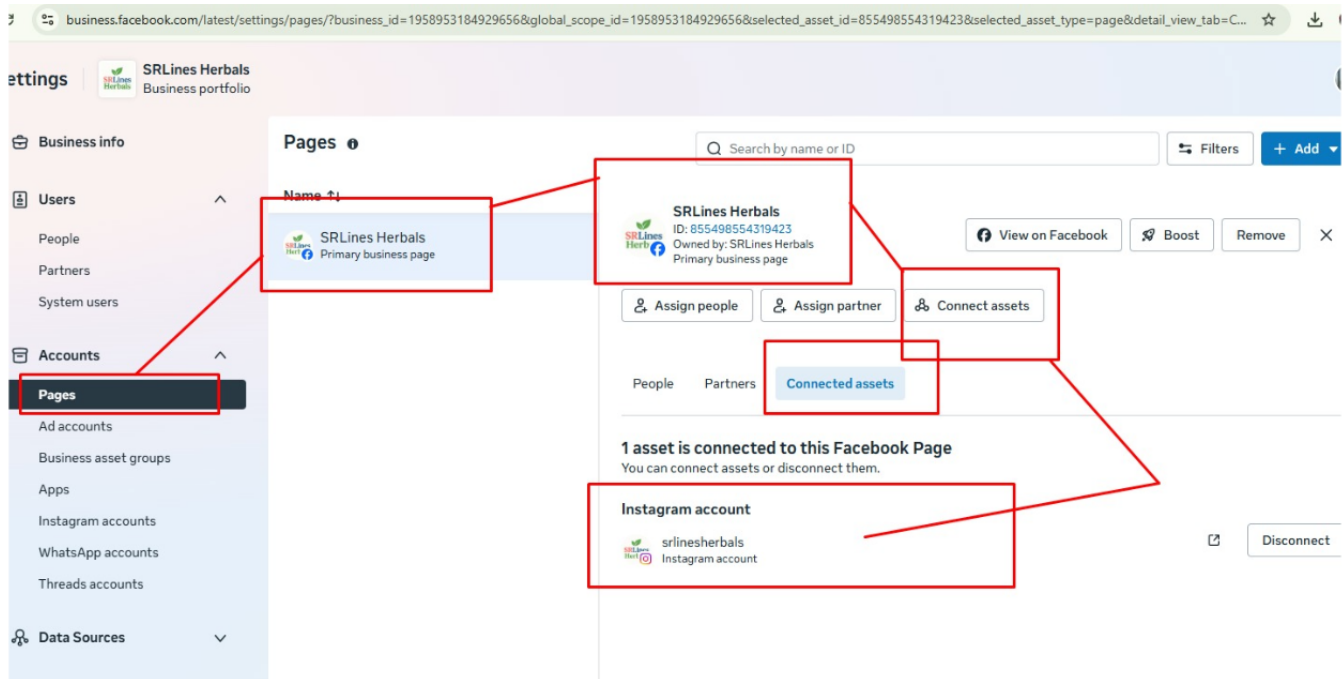

The Instagram account may be professional and the user may have completed an authorization flow, but the Instagram asset can still be absent from the Page's Connected assets relationship. This may happen after an incomplete Page/Instagram connection, connecting the wrong Page, moving assets between business portfolios, stale Meta synchronization, or a previous connection being removed without a clean re-link.

How to Connect the Instagram Asset

1. Open Meta Business Settings.
2. Go to **Accounts** → **Pages**.
3. Select the correct Facebook Page.
4. Open the **Connected assets** tab.
5. Click **Connect assets** and connect the correct Instagram account.
6. Confirm that the Instagram account now appears under the Page's Connected assets list.
7. After confirming the relationship, repeat the SRLINES onboarding/reconnection flow and test with a non-admin Instagram sender.

Expected Result: Instagram Appears Under Connected Assets

After a successful connection, selecting the Facebook Page and opening **Connected assets** should show the Instagram account attached to that Page, similar to the example below.

Example: Correct connection. The Instagram account is visible under the Facebook Page's Connected assets tab.

Final verification before testing SRLINES Omni Inbox

- Instagram account is Business or Creator
- Correct Facebook Page is selected
- Instagram appears under the Page's Connected assets
- Allow Access to Messages is ON in Instagram Connected Tools
- Account Status shows no relevant restriction
- Test DM is sent from a normal non-admin/non-tester Instagram account
