

SRLINES

THINK GLOBAL • GROW GLOBAL

wCRM AI Revenue Automation Suite

Turn conversations into faster answers, qualified opportunities, timely follow-ups, and confident human handoffs.

The promise

More responsive conversations. Better-qualified sales attention. Less repetitive work. A cleaner pipeline.

The difference

More than a chatbot: wCRM connects AI understanding to workflow actions, human ownership, follow-up, voice, knowledge and CRM pipeline movement.

24/7*

100

point qualification
framework

1-3

configurable WhatsApp
follow-ups

65+

qualification threshold +
evidence

*Availability depends on infrastructure and connected provider services.

1. Executive Overview

wCRM turns customer conversations into a controlled revenue workflow: answer quickly, understand intent, qualify opportunities, trigger actions, follow up when prospects go quiet, and hand conversations to people at the right time.

Faster responses

Trainable AI answers from approved business instructions, connected knowledge, catalog context and conversation history.

Better sales focus

Evidence-led qualification helps the team prioritize stronger opportunities instead of treating every enquiry equally.

Less manual chasing

Configurable sequential WhatsApp follow-ups nurture silent prospects while duplicate protections guard against accidental repeats.

Human-first control

When a teammate owns the conversation - or the chat is closed or spam-suppressed - AI stands down.

The revenue workflow

Commercial outcome: eligible enquiries can receive immediate, relevant responses; substantiated buying signals become structured CRM evidence; and handoffs can include the score, priority, stage and context a representative needs to act.

2. AI Sales & Service Assistant

A configurable AI node inside wCRM's visual Automation Studio - not a disconnected chat widget.

Business-controlled behavior

Define the assistant's role, tone, boundaries, discovery approach, escalation rules and selling guidance through training instructions.

Provider flexibility

Use supported OpenAI or DeepSeek models for generative responses. Provider behavior and availability remain deployment-dependent.

Conversation intelligence

- Conversation memory: configurable history gives the assistant continuity without repeatedly asking answered questions.
- Message batching: rapid fragments can be combined into one coherent request, reducing robotic reply spam.
- One useful next question: the nurturing policy focuses on the most valuable missing fact such as need, timing, budget, authority or next step.
- Safe boundaries: the assistant should not invent availability, policy, discount, delivery dates, prices, case studies or unsupported capabilities.

Intent becomes action

AI task triggers bridge flexible language understanding and deterministic automation. A recognized intent can route into a connected action instead of exposing internal signals to the customer.

Human assignment	Send image/video/audio/document
Reply buttons & list menus	Capture structured customer input
External API request	Continue, branch or stop automation

3. Grounded Knowledge - Not Generic Guesswork

wCRM can combine controlled business context so responses stay useful, relevant and commercially safer.

1. Conversation evidence

Recent inbound and outbound context helps the assistant understand the ongoing discussion. For qualification, only customer statements count as scoring evidence.

2. Google Sheets knowledge

A connected sheet can supply products, services, descriptions, exact prices, policies, URLs and niche facts selected for the current enquiry.

3. Training instructions

Defines business role, tone, boundaries, discovery approach, escalation rules and approved selling guidance.

4. Product catalog

Supplements explicitly requested product details such as name, description, price, currency, URL and imagery.

Knowledge-sheet operational snapshot

Maximum response	5 MB
Maximum rows	3,000
Selected matches	Up to 12
Cache lifetime	5 minutes
Retrieval	Lexical first; semantic enhancement when configured

Resilient answer path: optional enrichment failures are isolated. Knowledge retrieval, scoring, CRM persistence or voice generation should not silently suppress an otherwise valid customer response when a safe fallback exists.

4. Voice & Omnichannel Conversation Intelligence

wCRM carries channel and reply context through message delivery, enabling channel-sensitive behavior while preserving a consistent customer journey.

- WhatsApp: AI replies, state checks, spam prevention, catalog messages and automated follow-ups.
- Voice notes: audio can be transcribed, processed through the same AI workflow and optionally returned as synthesized speech.
- Meta comment context: supported reply paths can preserve the inbound comment identifier so the response remains connected to the relevant context.
- Fallback behavior: if speech generation or delivery is unavailable, text can remain the resilient response path.

Customer benefit

Customers can communicate in the medium that feels natural while receiving a consistent, context-aware experience.

Business benefit

Voice becomes part of the same sales and qualification workflow instead of a separate, untracked interaction.

5. Evidence-Led AI Lead Qualification

The qualification engine is intentionally conservative. Business knowledge and assistant output provide context, but customer messages are the evidence used to justify the score.

Criterion	Max	Accepted customer evidence
Interest	25	Names an offering or asks about price, feature, availability or suitability
Need / problem fit	25	States a pain point, goal, requirement, use case or desired outcome
Buying intent	20	Requests an order, quote, demo, proposal, consultation or contact
Timing / urgency	15	Gives a deadline, event date, purchase window or explicit urgency
Budget / authority	15	States budget context, affordability, approval path or decision authority

Qualification gate

A lead becomes Qualified only when the recomputed score is at least 65/100, customer evidence demonstrates genuine interest, customer evidence demonstrates a real need, and the opportunity is eligible for automatic movement.

- Each criterion is independently bounded; the application recomputes the total instead of trusting a model-supplied total.
- Missing information scores zero rather than being inferred.
- A generic first enquiry can show interest but cannot by itself establish need, intent, urgency, budget or authority.
- Protected Proposal, Won and manually locked stages remain human-controlled.

6. CRM Pipeline, Inbox & Human Ownership

Qualification is valuable only when it changes what the sales team does next. wCRM links conversation intelligence with pipeline and inbox state while preserving human control.

Qualified lead actions

Create/find a linked Kanban opportunity; save probability and priority; move an eligible card to Qualified; set the inbox to Pending for human attention.

Stage protection

Proposal, Won, manually locked Lost and other protected sales decisions are not silently overridden by background automation.

Human-first handoff

Once an eligible teammate is assigned, AI stands down. Routing can consider configured agents, presence, current load and unread targets.

Natural revival

A newer inbound customer message can reopen an eligible resolved conversation and revive an automatically Lost lead; outbound automation cannot fake customer activity.

Opportunity value safeguard: expected value is written only when a specific offering and exact approved price are unambiguously matched. A customer's stated budget is not treated as expected revenue.

7. Smart Sequential Follow-Up Automation

When a WhatsApp prospect goes quiet, wCRM can run a paced nurture sequence rather than relying on manual chasing or sending all reminders at once.

1-3 follow-up messages	1-720h validated delay range	50 latest state-history records	WhatsApp current follow-up channel
----------------------------------	--	---	--

Timing logic

- The first timer starts from the customer's latest inbound message.
- Each later timer starts only after the previous follow-up was successfully delivered.
- A new inbound customer message resets the silence window naturally.
- Only successful provider delivery advances the follow-up counter.

Eligibility & duplicate protection

Eligibility checks

Enabled workspace flow, persisted inbound history, active/open-like ticket, WhatsApp channel, no Spam tag and no AI-stop suppression.

Concurrency safeguards

Process overlap guard, per-conversation database advisory lock, fresh state read and post-success counter update.

Business result

Respectful persistence without accidental double-sends - and a cleaner distinction between genuinely recoverable demand and conversations that should remain suppressed.

8. Spam Protection, Inactivity Closing & Pipeline Hygiene

Pre-AI spam protection

High-confidence spam signals can tag and resolve a chat, persist suppression state, stop follow-ups and avoid unnecessary transcription, retrieval or generative AI spend.

Inactivity-based closing

Eligible inactive WhatsApp conversations can be resolved according to the configured policy, while protected Proposal/Won opportunities remain preserved.

Spam signals can include

- attachment-only placeholders or URLs
- common unsolicited promotion/scam-like phrases
- aggressive promotional calls to action
- multiple unsolicited links
- repeated-character or nonsensical content patterns

Current stale-chat policy

The audited workflow uses a 23-hour inactivity threshold for eligible WhatsApp chats. It may send a closure notice while still inside Meta's customer-service window; if execution is late, the notice can be skipped while the ticket is still resolved according to policy.

Pipeline hygiene: automatically closed opportunities can become Lost unless protected in Proposal or Won. New genuine inbound activity can reopen eligible automatically closed/lost conversations.

9. Automation Studio - Design the Journey Visually

The AI assistant sits beside deterministic building blocks, allowing teams to make customer journeys visible and configurable rather than burying all behavior in code.

MESSAGES	Text • Image • Video • Audio • Document • Location
INTERACTIVE	Reply buttons • List menus • Named input capture
LOGIC & TOOLS	External API request • Human assignment • End automation • AI assistant
AI TASK ROUTES	Recognized intent can select a connected deterministic action

End-to-end example

1	Prospect sends rapid messages and a voice note.
2	wCRM batches fragments and transcribes audio when configured.
3	Safety checks evaluate closed/spam state before paid AI work.
4	AI uses approved instructions, conversation context, relevant sheet rows and catalog context.
5	The assistant answers and asks one useful missing qualification question.
6	Qualification scores only customer-stated evidence.
7	At 65+ with interest and need, the opportunity can move to Qualified/Pending.
8	A consultation request can route to an agent or API action.
9	Human ownership suppresses AI competition.
10	If the prospect goes silent, the next configured follow-up is sent only when due.

10. Operational Controls, Deployment & Governance

Deployment requirements

- A functioning wCRM database and conversation storage.
- Connected Meta/WhatsApp messaging credentials for WhatsApp delivery.
- OpenAI or DeepSeek credentials for generative AI; OpenAI is required for Whisper transcription and optional embeddings.
- ElevenLabs credentials when spoken AI replies are enabled.
- Connected Google Sheets must be readable according to the configured retrieval approach.
- Catalog and Kanban modules initialized where those enrichments are required.

Security & governance principles

- Use least-privilege database and provider credentials and rotate exposed secrets.
- Keep customer-visible knowledge separate from internal notes and unsupported promises.
- Treat transcripts, mobile numbers, voice recordings, budgets and qualification evidence as sensitive business/personal data.
- Apply tenant scoping, retention controls, deletion/legal-hold processes and restore testing.
- Material pricing, legal, medical, financial, warranty and contractual statements should route to authorized humans.

Transparent boundaries

Output quality depends on model/provider choice, training instructions, source data, credentials and infrastructure. WhatsApp automation remains subject to Meta policies, customer consent, account status, applicable law and external provider charges.

11. Positioning for Sales Conversations

For sales leaders

Focus human effort on conversations that show real need and intent. AI answers routine questions, nurtures silence and promotes stronger opportunities for attention.

For founders & growth teams

Connect approved knowledge, shape the assistant in your brand voice and turn customer conversations into a living revenue pipeline.

For customer-support leaders

Give customers fast, grounded answers across text and voice while assigned agents retain control and stale tickets are handled consistently.

For operations leaders

Combine visual configuration with deterministic state checks, locks, scoped channels, safe fallbacks and auditable CRM updates.

Why wCRM feels different

- More than a chatbot: AI can route into real workflow actions.
- More than an inbox: conversations can become qualified opportunities.
- More than a campaign tool: follow-ups respond to conversation state and silence.
- Human-first: agent ownership suppresses AI competition.
- Knowledge-aware: prompts, sheets and catalog data work together.
- Multimodal: voice can enter the same workflow, with text as a resilient fallback.
- Guarded: spam and closed-state checks can run before paid AI work.

TURN YOUR INBOX INTO A REVENUE ENGINE

Respond instantly. Understand intent. Qualify responsibly.
Follow up thoughtfully. Hand off confidently.
