

wCRM AI Revenue Automation Suite

Turn conversations into faster answers, qualified opportunities, timely follow-ups, and confident human handoffs.

Client Presentation & Product Brochure

A concise, source-audited overview of the AI agent, qualification, workflow automation, follow-up, voice, and conversation-management capabilities in wCRM.

Promise: More responsive conversations. Better-qualified sales attention. Less repetitive work. A cleaner pipeline.

Executive Overview

wCRM turns customer conversations into a controlled revenue workflow: answer quickly, understand intent, qualify opportunities, trigger actions, follow up when prospects go quiet, and hand conversations to people at the right time.

Core Business Value

Faster responses	Trainable AI answers from approved instructions, connected knowledge, catalog context, and conversation history.
Better sales focus	Evidence-led lead scoring promotes stronger opportunities instead of treating every enquiry equally.
Less manual chasing	Configurable sequential WhatsApp follow-ups nurture silent prospects without accidental double-sends.
Human-first control	When a teammate is assigned, or a chat is closed/spam-suppressed, AI stands down.
Cleaner pipeline	Qualified conversations can move into CRM stages while stale or spam conversations are suppressed or closed.

AI Sales & Service Assistant

- Configurable OpenAI or DeepSeek models and business training instructions.
- Google Sheets can provide a lightweight, business-managed knowledge base.
- Catalog context can enrich product-specific enquiries with price, description, URL, and imagery.
- Conversation memory and message batching reduce fragmented, robotic replies.
- AI task triggers can route intent into deterministic workflow actions such as agent assignment, media, forms, API requests, or automation stops.

Voice & Omnichannel Intelligence

- WhatsApp conversations can use AI replies, catalog messages, state checks, spam prevention, and follow-ups.
- Voice notes can be transcribed with OpenAI Whisper, processed through the same AI workflow, and optionally returned as ElevenLabs speech.
- Meta comment context can be preserved so supported replies remain connected to the relevant conversation context.
- Text remains a resilient fallback when voice generation or delivery is unavailable.

Evidence-Led Lead Qualification

wCRM uses a 100-point framework across interest, need, buying intent, timing, and budget/authority. A lead qualifies only when the recomputed score reaches 65 or more and

customer messages show both genuine interest and a real need. Model-supplied totals are not trusted; scoring is recomputed from bounded criteria.

Qualification Outcomes

- Create or find a linked Kanban opportunity.
- Save qualification probability and normalized priority.
- Move qualified opportunities to the Qualified stage.
- Move eligible inbox conversations to Pending for human attention.
- Preserve manually locked opportunities and terminal Won/Lost stages.
- Set estimated value only when an exact matching business-knowledge price is available.

Smart Follow-Up Automation

When a WhatsApp prospect goes quiet, wCRM can send 1-3 configurable follow-ups with delays from 1 to 720 hours. Later delays begin only after the previous follow-up is successfully delivered. New inbound activity resets the silence window. Advisory locks and repeated eligibility checks protect against duplicate or inappropriate sends.

Human-First & Safety Guardrails

- Assigned agent -> AI stops.
- Resolved, closed, solved, or spam WhatsApp chat -> AI stops.
- AI reply-depth limit reached -> AI stops.
- Matched AI task -> deterministic workflow takes control.
- Spam screening runs before paid AI work where applicable.
- Knowledge, voice, or CRM persistence failures use safe fallbacks so the customer journey can continue when possible.

Automation Studio

The visual Automation Studio combines AI with text, image, video, audio, documents, locations, reply buttons, list menus, structured input capture, external API requests, human assignment, and stop conditions. This connects flexible AI understanding with visible, predictable business workflows.

Operational Snapshot

Message batching	1-8 seconds; runtime fallback 5 seconds.
Conversation memory	Builder options from 0 to 20 previous messages.
AI depth	0 means unlimited; bounded settings support 1-7 replies.
Knowledge sheet	Up to 5 MB, 3,000 rows, and 12 selected matches; 5-minute cache.

Qualification	65/100 plus demonstrated interest and need.
Follow-ups	Up to 3 WhatsApp messages; 1-720 hour delay validation.
Stale-chat closing	Current inactivity threshold: 23 hours for eligible WhatsApp chats.

Deployment Requirements & Boundaries

- A functioning wCRM database and conversation storage.
- Connected Meta/WhatsApp credentials for WhatsApp delivery.
- OpenAI or DeepSeek credentials for generative AI; OpenAI is required for Whisper transcription and optional embeddings.
- ElevenLabs credentials are required for spoken AI replies.
- Connected Google Sheets must be publicly readable by link.
- Provider availability, infrastructure uptime, account status, Meta policies, consent, applicable law, and external usage charges remain deployment dependencies.

Why wCRM

More than a chatbot, inbox, or campaign tool: wCRM connects AI understanding to real workflow actions, qualification, human ownership, follow-up, voice, catalog knowledge, spam protection, and CRM pipeline movement.

Closing

Respond instantly. Understand intent. Qualify responsibly. Follow up thoughtfully. Hand off confidently.

wCRM gives growing businesses an AI-powered conversation layer connected to automation, products, people, and pipeline - so customer interest does not stop at "message received."

Product behavior summarized here reflects the supplied source-audited brochure and remains subject to deployment configuration and third-party service availability.
